How to Choose the Optimal Starting Dose of Clomiphene Citrate (50 or 100 mg per Day) for a First Cycle of Ovulation Induction in Anovulatory PCOS Women?

[Article](#) [Full-text available](#)

Jul 2023

Lucie Huyghe · Camille Robin · Agathe Dumont · [...] · Geoffroy Robin

Research question: Clomiphene citrate (CC) is one of the first-line treatments for ovulation induction in women with anovulatory polycystic ovary syndrome (PCOS). However, nearly 1 out of 2 women is resistant to 50 mg/day of CC. The objective of this study is to investigate the clinical, biological, and/or ultrasound factors that may predict the r...

CANCER AND FERTILITY PRESERVATION. The integration of fertility preservation into the treatment pathway is a major issue for quality of life after cancer, particularly for very young children, adolescents and young adults. Responses must be adapted to age, gender and treatment. The recommendations of the French National Cancer Institute (INCa) aim...

Efficacy and safety of controlled ovarian hyperstimulation with or without letrozole for fertility preservation in breast cancer patients: A multicenter retrospective study

Article

Oct 2022

Oranite Goldrat · Manon De Cooman · Audrey Mailliez · [...] · Christine Decanter

Introduction Fertility preservation (FP) is recommended in young breast cancer (BC) patients before (neo)adjuvant treatment. Letrozole-associated controlled ovarian hyperstimulation (LetCOH) is used worldwide to collect mature oocytes for FP, but its efficacy and safety compared to conventional protocols (cCOH) are still debated. Aims To compare e...

Impact of endometriosis on oocyte morphology in IVF-ICSI: retrospective study of a cohort of more than 6000 mature oocytes

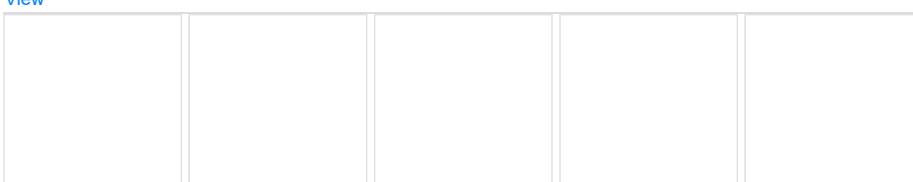

Article [Full-text available](#)

Oct 2021

Camille Robin · Audrey Uk · Christine Decanter · [...] · Geoffroy Robin

Background Infertility associated with endometriosis can be explained by several non-exclusive mechanisms. The oocyte plays a crucial role in determining embryonic competence and this is particularly relevant for in vitro fertilization (IVF) outcomes. According to some authors, the morphology of oocytes could also be a non-invasive marker of oocyte...

Christine Decanter · Marc Cloquet · Audrey Dassonneville · [...] · Pascal Pigny

(Abstracted from Reprod Biomed Online 2018;36:711–718) A late marker for the resumption of follicle growth after chemotherapy is the final recovery of menstrual activity. This can be monitored by measuring concentrations of anti-müllerian hormone (AMH), which is a real-time indicator of both follicular depletion and renewal of growth.

[Article](#) [Full-text available](#)

Mar 2014

[Maëlis Peigné](#) · [Christine Decanter](#)

Chemotherapeutic agents are notoriously ovarianotoxic in that they damage follicles. Anti-müllerian hormone (AMH) is a very sensitive indicator of the ovarian follicular content. The aim of this review was to investigate the interest of serum AMH variations in determining the acute and long-term effects of chemotherapy on the ovarian reserve. Thirteen E...

Polycystic ovary syndrome (PCOS) is the most common endocrine disorder in women of reproductive age and the leading cause of female infertility. This condition is frequently associated with significant metabolic disorders, including obesity and hyperinsulinemia. Therefore, it seems essential to focus on the pregnancy of these patients and possible...
